CRAFTSMANSHIP AND EXPERTISE IN DESIGNING HORSE STABLES

We attend to your challenges and find the perfect concept to keep your horses. Elegant and safe windows and doors are just as important to us as innovative approaches, such as our HAU 2- Point Safety Lock. Our Know Hau lies in the detail!

HAU. IT WORKS!

We manufacture our doors and windows in widths and height that fit your stable

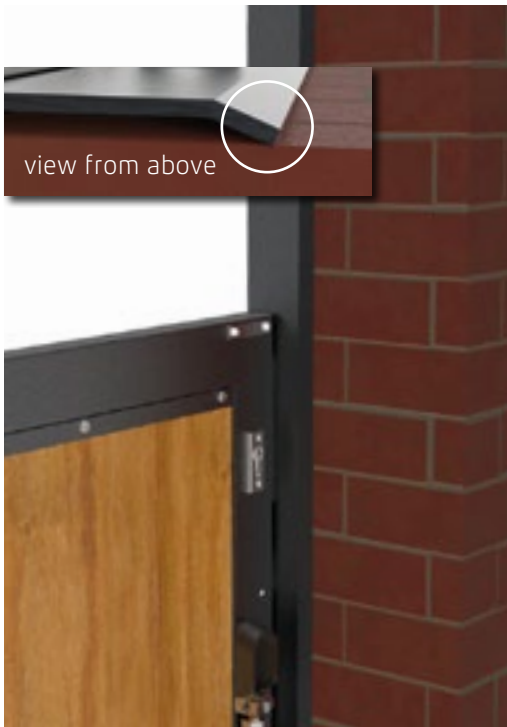

HAU 2- POINT SAFETY LOCK

The convenient one-hand operation locks two latching bolts at the same time. Thus, the door also locks at the bottom.

STAINLESS STEEL CLAPS HANDLE

Our handle ensures convenient operation of the stall doors both from the stall and the paddock.

view from above

SPECIAL STABLE FRAME

Due to their special shape, our door and window frames are flush-mounted into the opening avoiding dangerous edges.

ADJUSTABLE HINGES

All our stable doors and windows come with particularly compact, adjustable hinges

STABLE WINDOWS

Our stable windows are available as turn, tilt or turn-tilt windows. Apart from our standard size (width 125 cm x height 100 cm), we also manufacture our windows subject to order.

Due to its special design, the frame is flush-mounted into the opening avoiding dangerous edges. The wings come with particularly compact, adjustable hinges. The standard glazing consists of laminated safety glass (thickness of 6 mm).

The window is operated from inside by means of a square key. When open, the window can be fastened wind-proof. As an option, protective grids are available in various designs, as well as rigid and tilting skylights.

Our windows are hot-dip galvanized and may also be powder-coated if required.

For additional pictures of our stable windows, please visit our website:

TURN- WINDOWS

Our turn-windows open up to the outside at an angle of 180°. Apart from standard dimensions, we also manufacture subject to order.

HAU STANDARD STABLE WINDOW

- dimensions: width 125 cm x height 100 cm
- laminated safety glass (thickness 6 mm)
- special stable frame
- incl. wind-proofing
- optional protective grid available to facilitate cleaning

TURN- WINDOW

TILT WINDOWS

Our tilt-windows open up to the inside. A special mechanism securely fastens the window.

TILT WINDOW

TURN AND TILT WINDOWS

A tilt wing integrated into a turn window offers sufficient supply of fresh air also during the winter month.

STABLE DOORS

Our stable doors consist of 3 pieces: a frame and two leaves. Due to its special design, the frame is flush-mounted into the opening avoiding dangerous edges. The upper leaf may be opened independently from the lower leaf. The door comes with laminated safety glazing and may be equipped with an optional protective grid, which is available in various designs.

When open, the upper leaf can be fastened wind-proof. The lower leaf comes with a wood panelling (thickness of 32 mm) and our HAU 2-point safety lock. The convenient one-hand operation locks two latching bolts at the same time. The door is thus not only locked above but also below. Both leaves come with particularly compact, adjustable hinges.

The standard size of our stable doors is 125 cm (width) x 225 cm (height). Obviously, we also make them to order. All doors are hot-dip galvanized and may also be powder-coated if required.

Our paddock elements are hot-dip galvanized and are made of 3 horizontal bars (dia. 60 mm) welded subject to the safety spacing requirements of FN (Fédération Équestre Nationale, Deutsche Reiterliche Vereinigung e. V.) and the guidelines of BMEL (German Ministry for Food and Agriculture). Our standard elements have a length of 2 m, 3 m, and 4 m. Obviously, we also manufacture to order up to a length of 4 m. The welded design warrants for easy assembly and disassembly.

The elements are fixed with posts that may either be dowel-mounted or embedded in concrete. As an option, swivelling elements with convenient one-hand operation are also available as a grazing exit or in foal-proof design with a closed panelling.

PANELS

Assembled by a particularly refined plug-in system, our panels ensure a sturdy connection without dangerous gaps. The panels are connected by a bracket and may be fixed at any angle. To maintain appropriate distances and avoid injuries, our panels are designed with horizontal tubes. The elements are available in lengths of 2.5 m, 3m, and 3.5 m and an optional exit door.
